

Arrays in Java

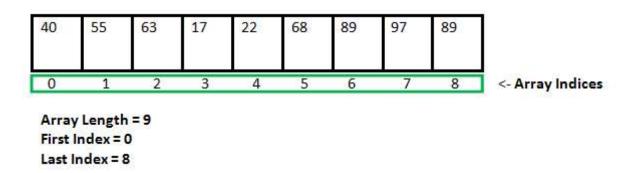

Last Updated: 24-04-2020

An array is a group of like-typed variables the work differently than they do in C/C++. Folk

- In Java all arrays are dynamically allocated tuscussed below;
- Since arrays are objects in Java, we can find their length using member length. This is different from C/C++ where we find length using sizeof.
- A Java array variable can also be declared like other variables with [] after the data type.
- The variables in the array are ordered and each have an index beginning from 0.
- Java array can be also be used as a static field, a local variable or a method parameter.
- The size of an array must be specified by an int value and not long or short.
- The direct superclass of an array type is Object.
- Every array type implements the interfaces Cloneable and java.io. Serializable.

Array can contains primitives (int, char, etc) as well as object (or non-primitives) references of a class depending on the definition of array. In case of primitives data types, the actual values are stored in contiguous memory locations. In case of objects of a class, the actual objects are stored in heap segment.

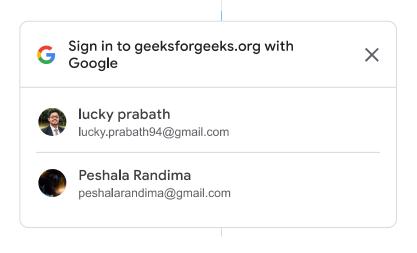

Creating, Initializing, and Accessing an Array

One-Dimensional Arrays:

The general form of a one-dimensional array declaration is

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
type var-name[];
OR
type[] var-name;
```

An array declaration has two components: the type and the name. *type* declares the element type of the array. The element type determines the data type of each element that comprises the array. Like array of int type, we can also create an array of other primitive data types like char, float, double..etc or user defined data type(objects of a class). Thus, the element type for the array determines what type of data the array will hold.

Example:

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
byte byteArray[];
                                            Sign in to geeksforgeeks.org with
short shortsArray[];
                                                                                   X
                                            Google
boolean booleanArray[];
long longArray[];
                                             lucky prabath
float floatArray[];
                                              lucky.prabath94@gmail.com
double doubleArray[];
char charArray[];
                                              Peshala Randima
                                              peshalarandima@gmail.com
// an array of references to objects
// the class MyClass (a class created by
// user)
MyClass myClassArray[];
Object[] ao,
                      // array of Object
Collection[] ca; // array of Collection
                      // of unknown type
```

Although the above first declaration establishes the fact that intArray is an array variable, **no array actually exists**. It simply tells to the compiler that this(intArray) variable will hold an array of the integer type. To link intArray with an actual, physical array of integers, you must allocate one using **new** and assign it to intArray.

Instantiating an Array in Java

When an array is declared, only a reference of array is created. To actually create or give memory to array, you create an array like this: The general form of *new* as it applies to one-dimensional arrays appears as follows:

```
var-name = new type [size];
```

Here, *type* specifies the type of data being allocated, *size* specifies the number of elements in the array, and *var-name* is the name of array variable that is linked to the array. That is, to use *new* to allocate an array, **you must specify the type and number of elements to allocate.**

Example:

```
int intArray[];   //declaring array
intArray = new int[20];  // allocating memory to array
```

```
// accessing the elements of the spe
                                             Sign in to geeksforgeeks.org with
                                                                                    X
 for (int i = 0; i < arr.length; i++)</pre>
                                             Google
   System.out.println("Element at ind
                                              lucky prabath
                                               lucky.prabath94@gmail.com
Implementation:
                                               Peshala Randima
                                               peshalarandima@gmail.com
// Java program to illustrate creating
// of integers, puts some values in the array,
// and prints each value to standard output.
class GFG
{
    public static void main (String[] args)
      // declares an Array of integers.
      int[] arr;
      // allocating memory for 5 integers.
      arr = new int[5];
      // initialize the first elements of the array
      arr[0] = 10;
      // initialize the second elements of the array
      arr[1] = 20;
      //so on...
      arr[2] = 30;
      arr[3] = 40;
      arr[4] = 50;
      // accessing the elements of the specified array
      for (int i = 0; i < arr.length; i++)</pre>
         System.out.println("Element at index " + i +
                                        " : "+ arr[i]);
    }
}
Output:
 Element at index 0:10
 Element at index 1: 20
 Element at index 2 : 30
```

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

- 1. The elements in the array allocated by *new* will automatically be initialized to **zero** (for numeric types), **false** (for boolean), or **null** (for reference types). Refer Default array values in Java
- 2. Obtaining an array is a two-step process. First, you must declare a variable of the desired array type. Second, you must allocate the memory that will hold the array, using new, and assign it to the array variable. Thus, **in Java all arrays are dynamically allocated.**

Array Literal

In a situation, where the size of the array and variables of array are already known, array literals can be used.

```
int[] intArray = new int[]{ 1,2,3,4,5,6,7,8,9,10 };
// Declaring array literal
```

- The length of this array determines the length of the created array.
- There is no need to write the new int[] part in the latest versions of Java

Accessing Java Array Elements using for Loop

Each element in the array is accessed via its index. The index begins with 0 and ends at (total

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

You can also access java arrays using foreach loops

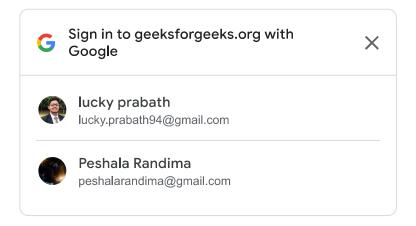

Arrays of Objects

An array of objects is created just like an array of primitive type data items in the following way.

Student[] arr = new Student[7]; //student is a user-defined class

The studentArray contains seven memory spaces each of size of student class in which the address of seven Student objects can be stored. The Student objects have to be instantiated using the constructor of the Student class and their references should be assigned to the array elements in the following way.

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
Student[] arr = new Student[5];
// Java program to illustrate creating an array of
// objects
class Student
{
    public int roll_no;
    public String name;
    Student(int roll_no, String name)
        this.roll no = roll no;
        this.name = name;
   }
}
// Elements of array are objects of a class Student.
public class GFG
{
    public static void main (String[] args)
    {
        // declares an Array of integers.
        Student[] arr;
        // allocating memory for 5 objects of type Student.
        arr = new Student[5];
        // initialize the first elements of the array
        arr[0] = new Student(1, "aman");
        // initialize the second elements of the array
        arr[1] = new Student(2, "vaibhav");
        // so on...
        arr[2] = new Student(3, "shikar");
        ann[3] - now Student(/ "dhanmach").
```

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
for (int i = 0; i < arr.length; i++)</pre>
              System.out.println("Elemer
                           arr[i].roll_r
                                                Sign in to geeksforgeeks.org with
                                                                                         X
    }
                                                Google
}
                                                 lucky prabath
Output:
                                                 lucky.prabath94@gmail.com
 Element at 0 : 1 aman
                                                 Peshala Randima
                                                 peshalarandima@gmail.com
 Element at 1 : 2 vaibhav
 Element at 2 : 3 shikar
 Element at 3 : 4 dharmesh
 Element at 4 : 5 mohit
```

What happens if we try to access element outside the array size?

JVM throws **ArrayIndexOutOfBoundsException** to indicate that array has been accessed with an illegal index. The index is either negative or greater than or equal to size of array.

Runtime error

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 2
   at GFG.main(File.java:12)
```

Output:

Passing Arrays to Methods

Like variables, we can also pass arrays to methods. For example, below program pass array to method *sum* for calculating sum of array's values.

```
// Java program to demonstrate
// passing of array to method
class Test
    // Driver method
    public static void main(String args[])
        int arr[] = {3, 1, 2, 5, 4};
        // passing array to method m1
        sum(arr);
    }
    public static void sum(int[] arr)
        // getting sum of array values
        int sum = 0;
        for (int i = 0; i < arr.length; i++)</pre>
            sum+=arr[i];
        System.out.println("sum of array values : " + sum);
    }
}
```

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
sum of array values : 15
                                               Sign in to geeksforgeeks.org with
                                                                                       X
                              Returning /
                                               Google
As usual, a method can also return an array
                                                lucky prabath
method m1.
                                                lucky.prabath94@gmail.com
                                                Peshala Randima
// Java program to demonstrate
                                                peshalarandima@gmail.com
// return of array from method
class Test
     // Driver method
     public static void main(String args[])
         int arr[] = m1();
         for (int i = 0; i < arr.length; i++)</pre>
             System.out.print(arr[i]+" ");
     }
     public static int[] m1()
         // returning array
         return new int[]{1,2,3};
     }
}
Output:
 1 2 3

                                              Google
component type.
                                               lucky prabath
                                               lucky.prabath94@gmail.com
// Java program to demonstrate
// Class Objects for Arrays
                                               Peshala Randima
                                               peshalarandima@gmail.com
class Test
{
    public static void main(String args[])
         int intArray[] = new int[3];
         byte byteArray[] = new byte[3];
         short shortsArray[] = new short[3];
         // array of Strings
         String[] strArray = new String[3];
         System.out.println(intArray.getClass());
         System.out.println(intArray.getClass().getSuperclass());
         System.out.println(byteArray.getClass());
         System.out.println(shortsArray.getClass());
         System.out.println(strArray.getClass());
    }
}
Output:
 class [I
 class java.lang.Object
 class [B
 class [S
 class [Ljava.lang.String;
```

Explanation:

- 1. The string "[I" is the run-time type signature for the class object "array with component type *int*".
- 2. The only direct superclass of any array type is java.lang.Object.
- 3. The string "[B" is the run-time type signature for the class object "array with component type *byte*".
- 4. The string "[S" is the run-time type signature for the class object "array with component

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

Now as you know that arrays are object of a class and direct superclass of arrays is class Object. The members of an array type are all of the following:

- The public final field *length*, which contains the number of components of the array. *length* may be positive or zero.
- All the members inherited from class Object; the only method of Object that is not inherited is its clone method.
- The public method clone(), which overrides clone method in class Object and throws no checked exceptions.

Cloning of arrays

When you clone a single dimensional array, such as Object[], a "deep copy" is performed
with the new array containing copies of the original array's elements as opposed to
references.

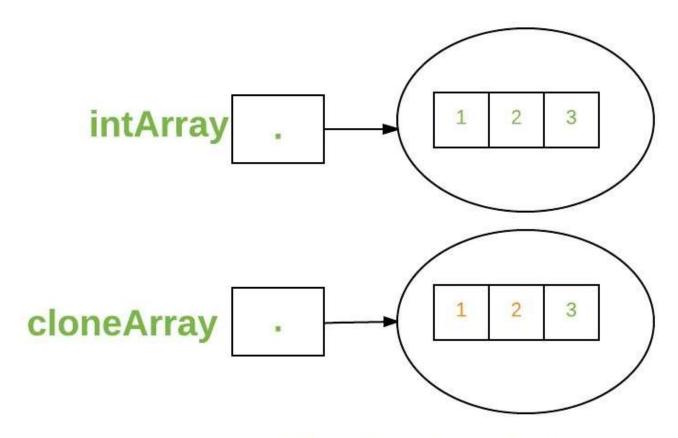

```
// Java program to demonstrate
// cloning of one-dimensional arrays

class Test
{
    public static void main(String args[])
```

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

false 1 2 3

Deep Copy is created for one-dimensional array by clone() method

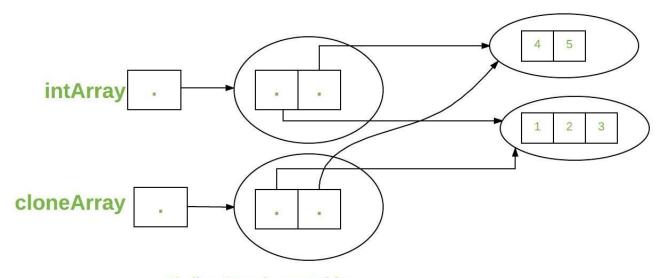

• A clone of a multidimensional array (like Object[][]) is a "shallow copy" however, which is to say that it creates only a single new array with each element array a reference to an

We use cookies to ensure you have the best browsing experience on our website. By using our site, you acknowledge that you have read and understood our <u>Cookie Policy</u> & <u>Privacy Policy</u>

```
// cloning of multi-dimensional arrays
class Test
                                        Sign in to geeksforgeeks.org with
                                                                               X
                                        Google
    public static void main(Stri
    {
        int intArray[][] = {{1,2}
                                          lucky prabath
                                          lucky.prabath94@gmail.com
        int cloneArray[][] = int/
                                          Peshala Randima
        // will print false
                                          peshalarandima@gmail.com
        System.out.println(intAr
        // will print true as shallow copy is created
        // i.e. sub-arrays are shared
        System.out.println(intArray[0] == cloneArray[0]);
        System.out.println(intArray[1] == cloneArray[1]);
    }
```

Output:

false true true

Shallow Copy is created for multi-dimensional array by clone() method
